IT Career Development Plan

DUSTIN PERRERA | BSIT STUDENT | OCTOBER 26, 2026

01 / Career direction

My target is a junior web developer role, while continuing to grow in mobile development and taking on suitable freelance projects. I want to build useful business websites and systems by understanding the people who will use them.

02 / Current skills and areas for improvement

Building Breathe Easy Solution, SneakDup, and DCSA Mini LMS has given me practical experience with website and application interfaces, databases, integrations, and troubleshooting. I am learning to connect technical features with client needs and everyday workflows. Programming fundamentals and logical thinking are my main priorities. I also want to improve how I gather requirements, compare possible solutions, and plan a design before development. I will practice explaining and debugging code so that faster development also leads to stronger understanding.

03 / Technologies and certifications to consider

I plan to deepen JavaScript, PHP, MySQL, and Git skills, and continue learning Kotlin and Firebase for mobile development. Testing, database record checks, and secure form handling will support my project work. I will consider relevant database or web security certificates after completing practical exercises.

04 / Career milestones

6 MONTHS	1 YEAR	3 YEARS
Strengthen the foundations	**Prepare for professional work**	**Grow in responsibility**
Practice coding regularly, complete a documented SQL exercise, and improve testing and documentation for my existing projects.	Apply for suitable junior developer opportunities, practice interview answers, and build experience collaborating with others.	Handle larger features more independently, explain technical decisions confidently, and choose a specialization based on practical experience.

05 / Personal development strategy

Each week, I will set aside time for coding practice, one project improvement, and a short review of what I learned. Before changing direction, I will compare the new idea with the client's goals. I will attempt small features independently, then use AI for explanations or review and verify the result myself.

06 / Career vision

I want to become a dependable developer who listens carefully, explains decisions clearly, and keeps improving. I understand that graduation does not guarantee employment. My next steps are to strengthen my skills, show evidence of my work, and stay open to feedback.

Review rhythm: revisit this plan every three months and adjust it as my experience and priorities develop.
