01 / TROUBLESHOOTING JOURNAL - CASE 01 OF 05

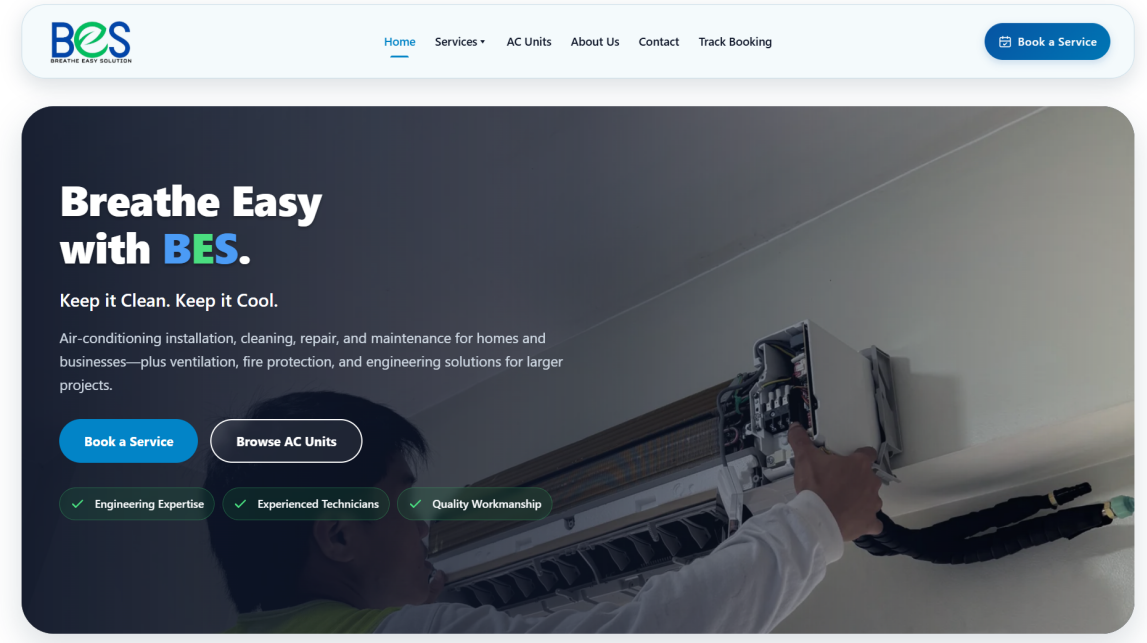

When booking emails did not reach customers.

Dustin Perrera | Web Developer | Breathe Easy Solution

Prepared 19 October 2026

A customer should receive a confirmation after submitting a service booking. In this project, that email sometimes failed to arrive, so I investigated the code and email API used by the booking flow.

Project context

Actual Breathe Easy Solution homepage screenshot. It establishes project context; the email failure is not visible in this image.

01 / Confirmation did not arrive

Some customers submitted a booking but did not receive the expected confirmation email.

> **RECORD SCOPE**
>
> This journal currently documents one completed software troubleshooting case. The remaining four cases will be added from completed work.

Investigation and resolution

BOOKING CONFIRMATION FLOW

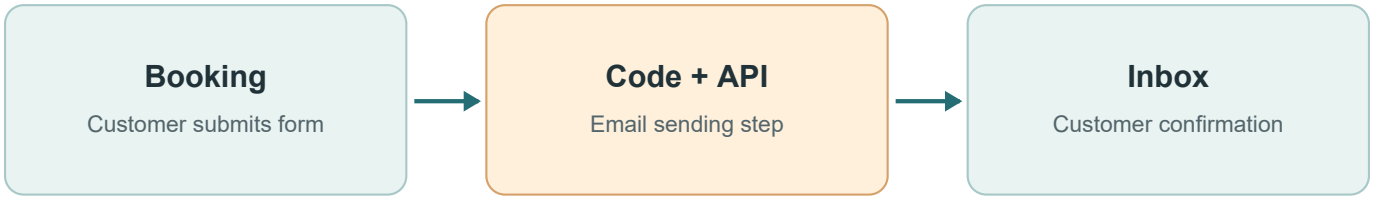

Illustration of the sending path investigated. This is not an error log or delivery receipt.

02 / Where the failure could occur

The booking code might not call the email API correctly; the recipient address or request data could be wrong; or the email service could reject or filter a message. These were possibilities to investigate, not confirmed root causes.

03 / Checked the sending path

I reviewed the email API integration and the program logic responsible for sending customer booking confirmations, looking for why the message did not consistently reach the customer.

04 / Corrected the integration

I fixed the issue in the email-related code and API setup. Customer booking confirmations began arriving again.

05 / Check the complete customer journey

A submitted booking and a delivered confirmation are separate outcomes. The email step needs its own checks so a sending failure can be noticed and resolved quickly.

> **EVIDENCE NOTE**
>
> The diagnosis and outcome are described from my project experience. Exact API error responses, code changes, and email delivery logs are not included in this record.
